

CEO GIRL AI

The Digital Product Pricing Calculator + Guide

Step 4 of 6: Price it with math and confidence — not a guess, and not the number that felt least scary to type.

"Underpricing doesn't attract more buyers. It attracts the wrong ones."

CEO GIRL AI

WELCOME

Pricing Is Math and Psychology

Read this first

Most first-time sellers price based on what feels safe to charge, not on what the offer is actually worth. That number usually comes from fear — of rejection, of seeming greedy, of nobody buying — not from the transformation being delivered. This guide walks you through both sides: the math (what you need to charge to make this sustainable) and the psychology (getting comfortable actually asking for it).

By the end, you'll have:

- ☐ A clear read on the pricing models available to you
- ☐ A worked-out price based on value delivered, not just guesswork
- ☐ A competitor price audit so you know where you sit in the market
- ☐ A full price ladder across your product line, low to high

Pricing Models, Explained Simply

Pick the one that fits how your offer is delivered

Model	Best for	Watch out for
One-time payment	Templates, workbooks, single trainings	No recurring revenue — needs consistent new buyers
Tiered pricing	Offers with a clear "basic vs. full" version	Too many tiers creates decision fatigue
Payment plan	Higher-ticket offers (\$200+)	Adds admin overhead, plan for non-payment
Subscription	Ongoing access, communities, evolving content	Requires ongoing delivery, not just a one-time build

Your Model

Given your offer from Step 2, which model fits best right now? You can always add tiers or a payment plan later — don't overbuild before you've sold the first one.

.....

The Value-Based Pricing Calculator

Work the numbers before you pick a number

Question	Your answer
What's the tangible result of your offer (time saved, money made, problem solved)?	
What's that result roughly worth to your customer, in dollars or hours?	
What would she pay elsewhere for a worse or slower version of this?	
What's the minimum price that would make your time worth building this?	

The Anchor Number

Value-based pricing usually lands your price well below the value delivered — most digital products are priced at 5–15% of the value they create. Using your answers above, what does that suggest as a starting price range?

.....

The Competitor Price Audit

Know the market before you price against it

Similar offer	Their price	What they include	How yours compares

AI companion prompt: "Here's my offer: [describe it], and here's what similar products in this space typically cost: [list what you found]. Help me figure out where my offer should sit in that range, and why."

Getting Comfortable Charging It

The psychology side

Reframe the Discomfort

What you might think	A more accurate reframe
"This feels like a lot to charge"	It feels like a lot to say out loud — that's different from it not being worth it
"What if no one pays this?"	Then you learn something about positioning, not that you should apologize for the number
"I should charge less so more people can afford it"	Underpricing doesn't make it accessible — it makes it feel low-value to everyone, including the people you wanted to help

Say the Price Out Loud

Practice saying your final price out loud, plainly, without a nervous laugh or a disclaimer after it. If that's hard right now, that's exactly why this exercise exists.

Your Full Price Ladder

Map your whole product line, low to high

Not every product needs to be your main offer's price. A price ladder gives people a lower-cost way in and a higher-cost way to go deeper.

Tier	Product	Price	Who it's for
Entry			
Core offer			
Premium / 1:1			

PRICED WITH CONFIDENCE

Your Number Is Backed by Math Now

Not a guess, not a fear-based discount — a price you
can defend and say out loud without flinching. Next:
build the actual 30-day plan to launch it.
